23	Luxembourg	17	26	65%
24	Estonia	17	23	75%
25	Lithuania	15	24	65%
26	Latvia	10	24	40%
27	Cyprus	7	27	25%
28	Malta	7	7	100%

Table 2. Access to Precision Medicine¹

Precision Oncology in 2025: More targets, more testing

More Targeted Therapies and updated testing guidelines¹

Moving to early stages Reflex testing as the new standard²

Pathologist-initiated reflex testing for biomarkers in non-small-cell lung cancer: expert consensus on the rationale and considerations for implementation

J. R. Gosney¹, L. Paz-Ares², P. Jänne³, K. M. Kerr⁴, N. B. Leigh⁵, M. D. Lozano⁶, U. Malapelle⁷, T. Mok⁸, B. S. Sheffield⁹, A. Tufman^{10,11,12}, I. I. Wistuba^{13,14} & S. Peters^{15*}

- “Reflex testing is expeditious and standardises the ordering of biomarker tests to ensure more patients are tested.”
- “Recent clinical and technological advancements will help to overcome concerns of increased costs and limited reimbursement.”

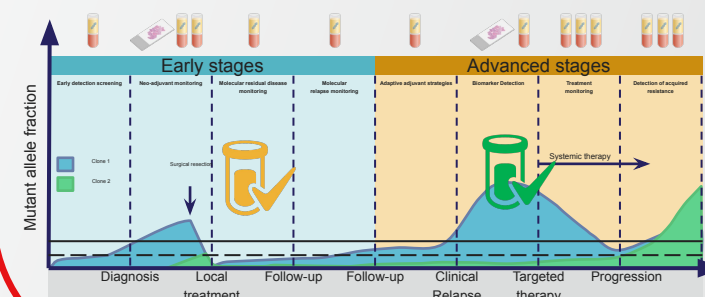

ADAURA trial³
EGFR TKI adjuvant

ALINA trial⁴
ALK TKI adjuvant

Less invasive diagnostics Liquid Biopsy

- Liquid biopsy continues a viable salvage pathway in the absence of adequate tissue.⁵
- Key clinical indications for LBx:**
 - NSCLC @ diagnosis and progression⁵
 - Prostate cancer @ diagnosis⁶
 - Metastatic breast cancer @ progression⁷

HRD ^a	HRD	50% high-grade serous ovarian cancer	IA	PARP inhibitors	Mirza et al., <i>N Engl J Med</i> 2016 ¹¹⁰ Coleman et al., <i>Lancet</i> 2017 ¹¹¹ González-Martin et al., <i>N Engl J Med</i> 2019 ¹¹⁴ Ray-Coquard et al., <i>N Engl J Med</i> 2019 ¹¹⁵ González-Martin et al., <i>Ann Oncol</i> 2023 ¹¹⁷

ESCAT, ESMO Scale for Clinical Actionability of molecular Targets; HRD, homologous recombination deficiency; PARP, poly (ADP-ribose) polymerase.

^aSignature.

Table 7. List of genomic alterations level I/II according to ESCAT in advanced ovarian cancer¹

Clinical Evidence: PARP Inhibitors in Ovarian Cancer

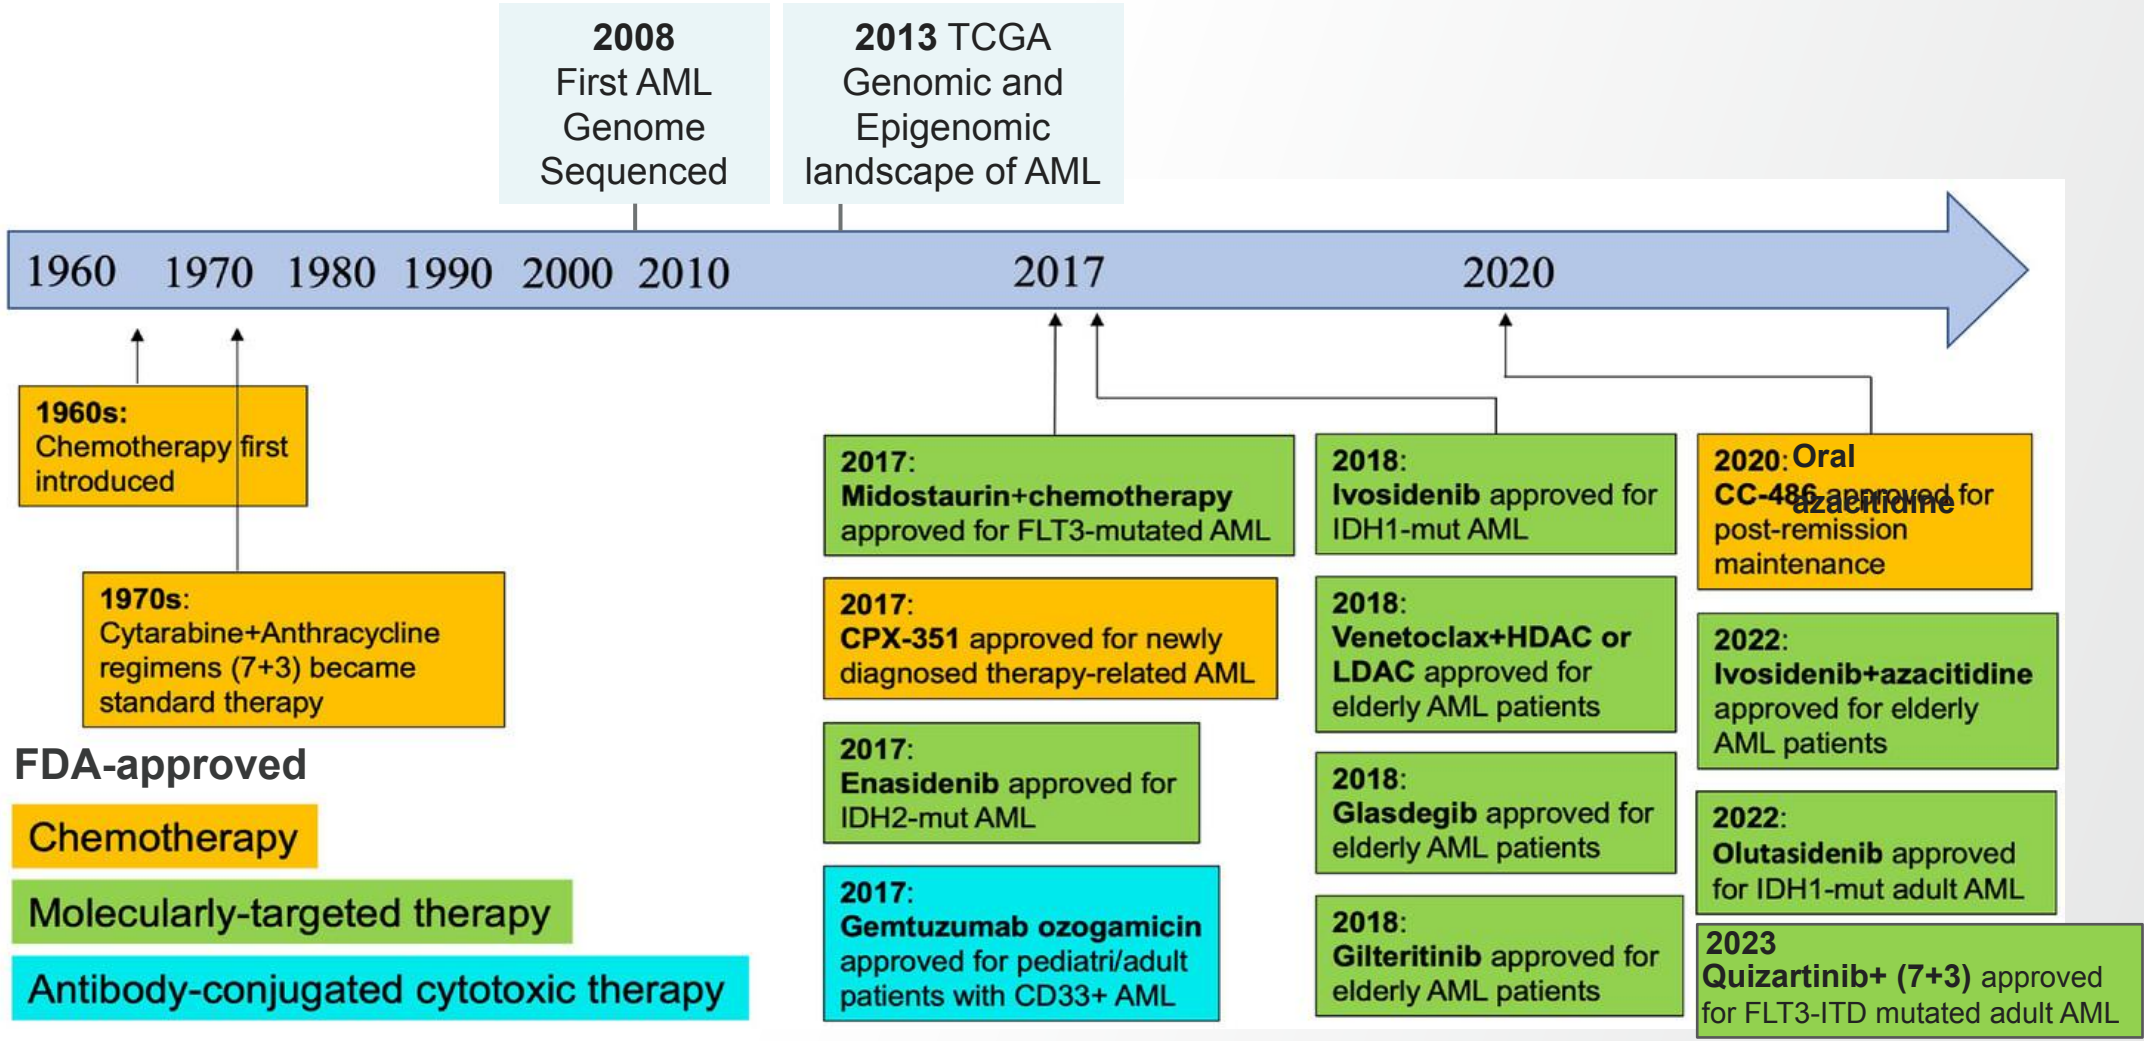

PAOLA-1: PFS by HRD Status

In 2020, based on the phase III PAOLA-1 study, the FDA and EMA approved olaparib plus bevacizumab for the maintenance treatment of HRD positive ovarian cancer

Genomic profiling enables advancements in the treatment of AML patients

AML patients can benefit from a more individualized treatment approach

Park HJ and Gregory MA, Aging and Cancer Blood 2023 (doi:10.1002/aac2.12065)
Lachowiez CA et al., Cancers 2023 (doi:10.3390/cancers15051617)
Marando L, Huntly BJP., Curr Oncol Rep. 2020 (doi:10.1007/s11912-020-00918-7)

AML: Risk classification based on genetic markers

2022 European LeukemiaNet (ELN) recommendations

Status	Genetic abnormality	
Favorable	<ul style="list-style-type: none"><i>RUNX1-RUNX1T1</i><i>CBFB-MYH11</i>Mutated <i>NPM1</i> without <i>FLT3</i>-ITD<i>bZIP</i> in-frame mutated <i>CEBPA</i>	
Intermediate	<ul style="list-style-type: none">Mutated <i>NPM1</i> with <i>FLT3</i>-ITDWild-type <i>NPM1</i> with <i>FLT3</i>-ITD (without adverse-risk genetic lesions)<i>MLLT3-KMT2A</i>Cytogenetic abnormalities not classified as favorable or adverse	
Adverse	<ul style="list-style-type: none"><i>DEK-NUP214</i><i>KMT2A</i> rearranged<i>BCR-ABL1</i><i>KAT6A-CREBBP</i>-5 or del (5q); -7; 17/abn(17p)<i>GATA2</i>, <i>MECOM(EVI1)</i>Complex karyotype, monosomal karyotypeMutated <i>ASXL1</i>, <i>BCOR</i>, <i>EZH2</i>, <i>RUNX1</i>, <i>SF3B1</i>, <i>SRSF2</i>, <i>STAG2</i>, <i>UTAF1</i>, or <i>ZRSR2</i>Mutated <i>TP53</i>	

12 biomarkers recently added in 2022 (in red)

Comparison between the ELN 2022 and 2017

ELN 2022 recommends testing more genetic biomarkers

Real-world genomic testing in AML older patients impacts patient outcome – Research Study

629 newly diagnosed adult AML (*Indiana University Health System Enterprise Data Warehouse**)

Only 13% of patients have genomic sequencing reports, with the majority of patients <60 years

Elderly patients (≥ 75 years) had the highest proportion (46%) of **multiple** (≥ 3) mutations

Elderly patients who underwent genomic testing have a **longer OS**

**from 2011 to 2018*

Access to genomic testing may increase treatment options, especially for elderly AML patients

Single-gene testing cannot keep up the pace

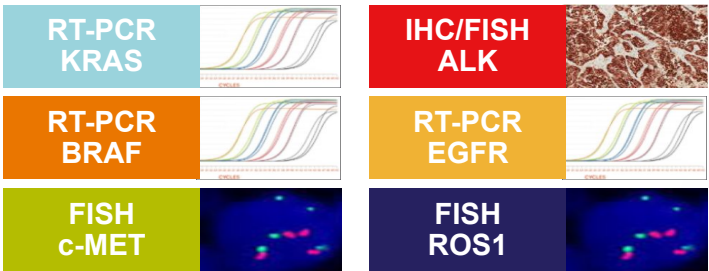

NGS is fundamental to ensure patient care^{1,2}

Single gene testing

NSCLC

- × *Insufficient material*
- × *Incomplete testing*
- × *Long time to treatment*

Next-generation sequencing

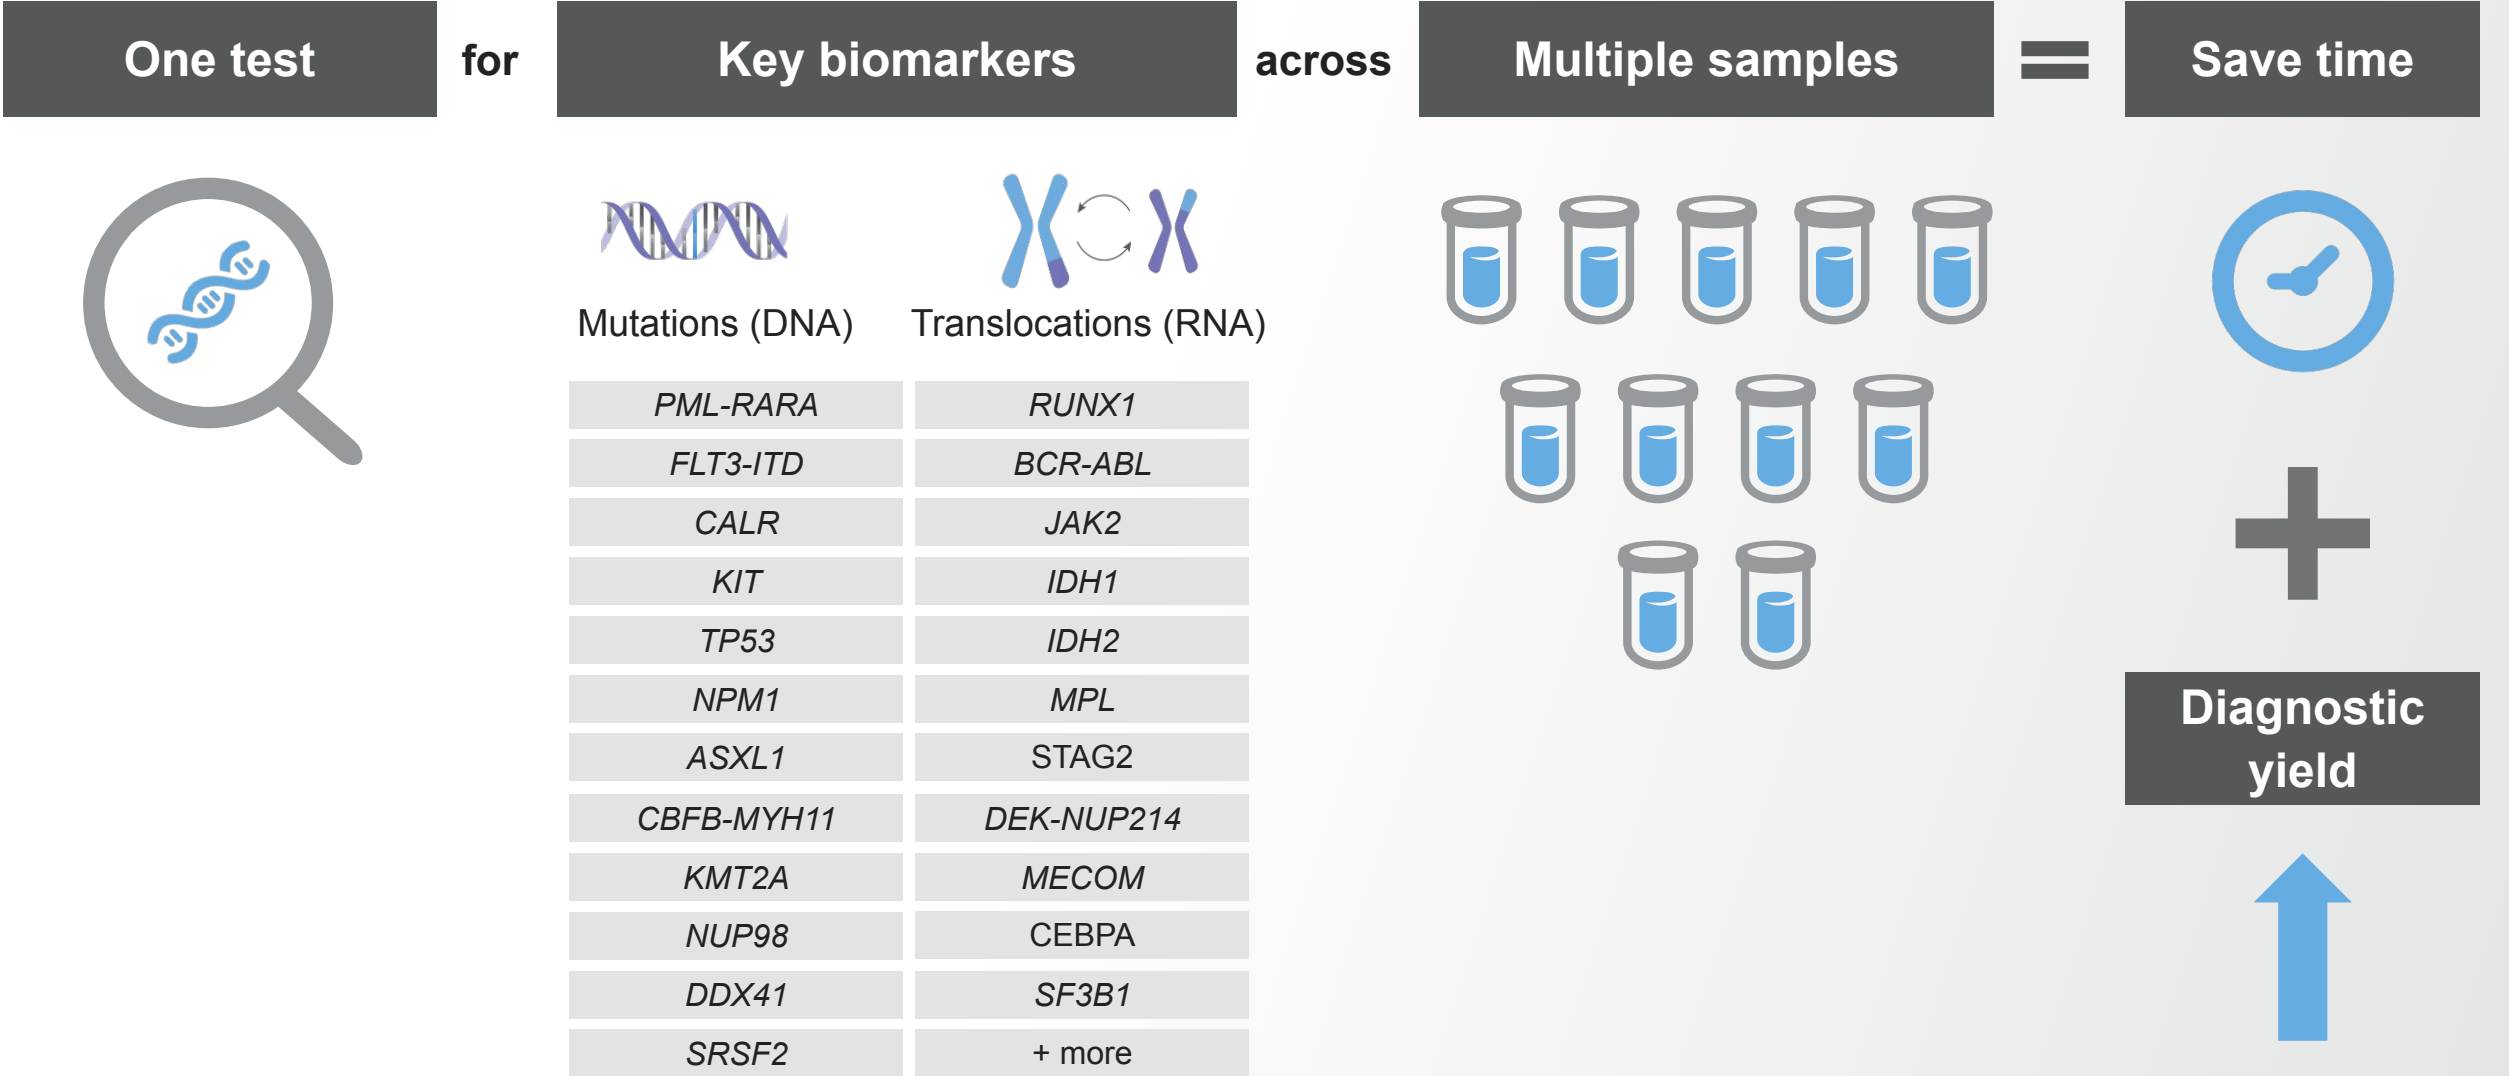

- ✓ *simple workflow*
- ✓ *One sample*
- ✓ *Multiple markers*

NGS enables parallel detection of relevant biomarkers in a single test

1. Arriola et al., JCO Precision Oncology no. 7 (2023) e2200546
2. Kerr et al., Lung Cancer 154 (2021) 161–175

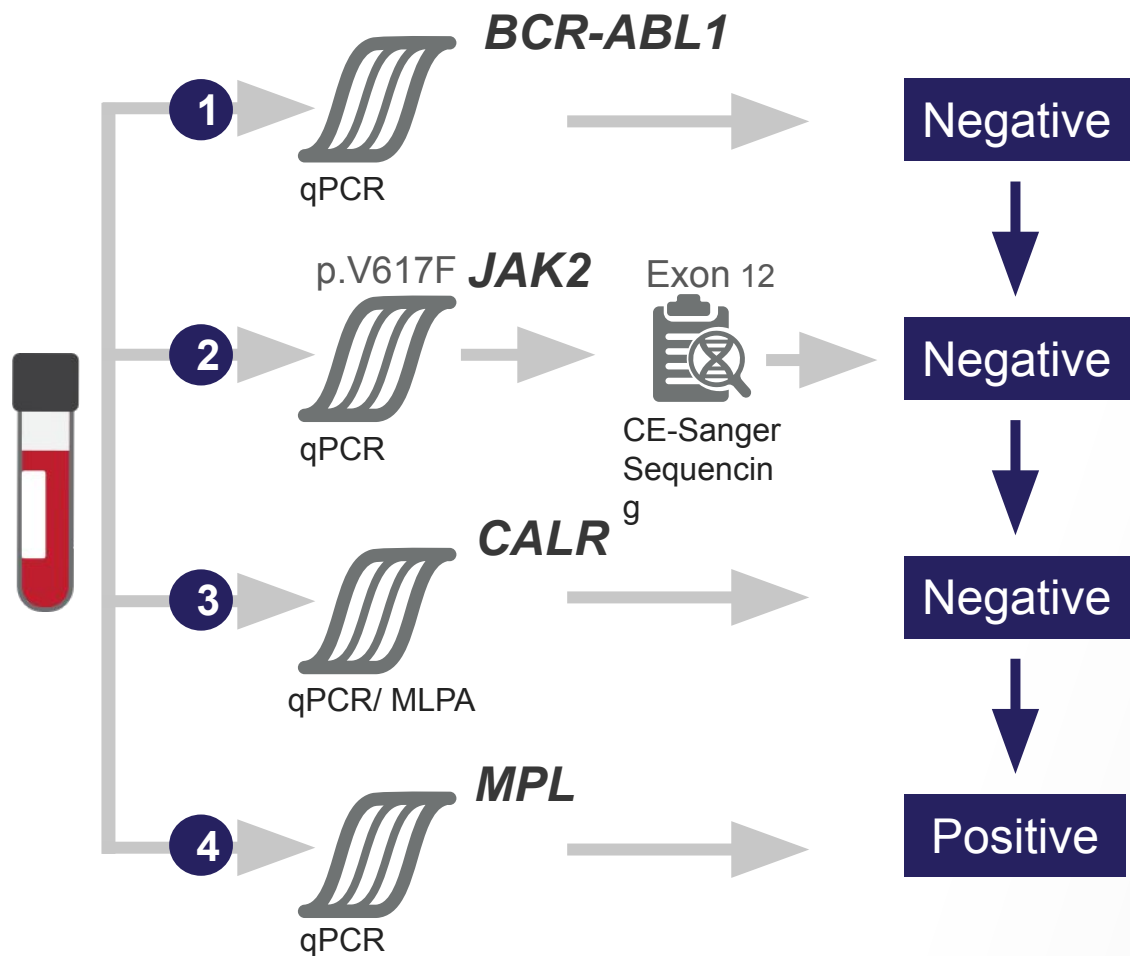

NGS allows efficient multi-haematologic biomarker testing

Myeloproliferative neoplasms (MPN) molecular testing needs to be all-encompassing at the first pass-one

Traditional sequential biomarker testing strategy

MPN sequential testing

Limitations of sequential biomarker testing:

- increases labor and time burden for labs
- can miss co-occurring mutations

 **Coexisting *JAK2* and *CALR* variants were reported**
(frequency non-accurate, <1% to 6.8%)

NGS identifies more patients in a more cost-efficient manner

NGS is more cost efficient than single-gene testing²

Figure 2. Total budget impact of increasing the proportion of patients tested with NGS from 50% to 70%. **Abbreviations:** NGS = next-generation sequencing. **Notes:** a. Costs include gene testing costs, rebiopsy costs, costs for interventional radiologist and oncologist visits, and costs of PD-L1 testing. b. Total costs include genetic testing costs, medical costs associated with testing, and estimated costs of delayed care. The estimated costs associated with delaying treatment were calculated as the time to initiation of appropriate targeted therapy times estimated weekly cost during the pre-diagnosis phase.

Compared to Single-gene testing, NGS identifies more patients positive for actionable biomarkers and potentially reduces the economic burden on the healthcare system^{1,2}

1. Sheffield BS et al.Curr. Oncol. 2023 (doi:10.3390/currncol30020180)
2. 2023 Publ in The Oncolist, Genomic Testing Cost Calculator Stenzinger A. Et al., The Oncologist, 2023, 28, e242-253

Patient survival is positively influenced by timely genomic testing

Patients with genomic profile available for 1st line therapy decision have **4x longer median overall survival (aNSCLC)**

80% (n=261) genomic profile **available** before 1L
Median overall survival **24.6 months**

20% (n=144) **unavailable** before 1L
Median overall survival **6.2 months**

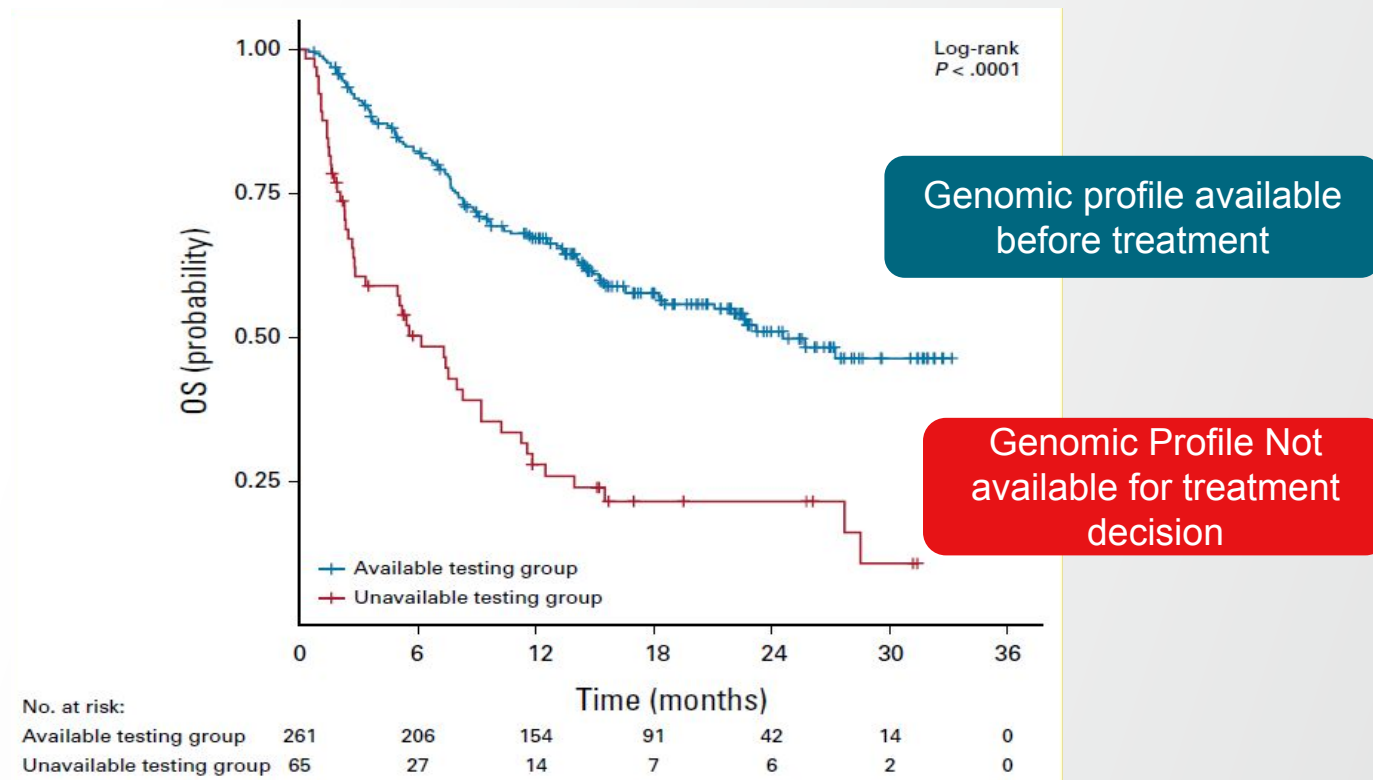

Figure: association between availability of molecular genotyping results and overall survival in patients with advanced nonsquamous non-small-cell lung cancer¹

Patients treated based on molecular test results have better clinical outcomes

Long turnaround times result in suboptimal outcomes

Turn-around time (TAT) is a key factor for therapy initiation and clinical trials recruiting

The Problem

22.4 days

Average TAT of NGS-based tumor biomarker results in U.S.¹

The Consequences

27%

NSCLC patients are treated *before* molecular profiling results are delivered.²

Patients treated based on molecular test results have better clinical outcomes² – but results are needed faster, closer to the patient.

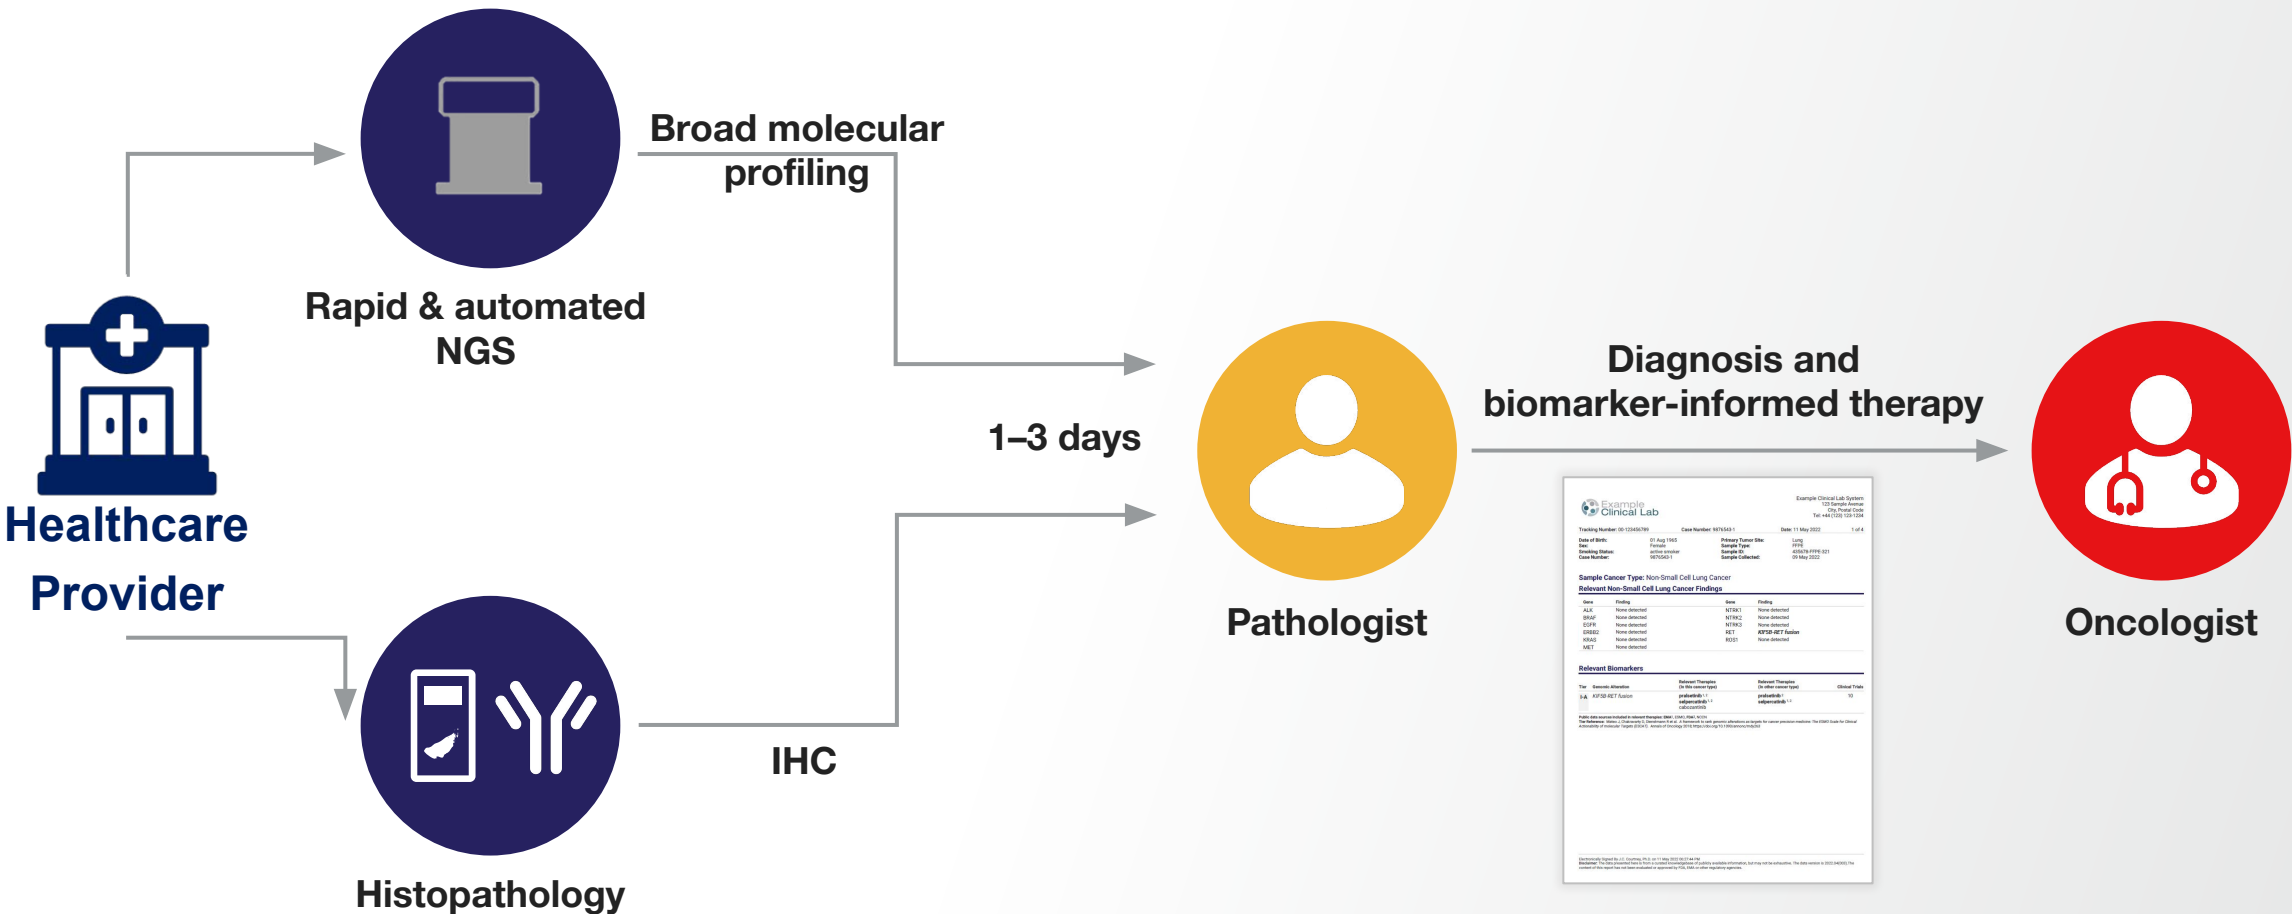

TAT: turn-around time; NGS: next-generation sequencing, NSCLC: non-small cell lung cancer

1. Smith RE et al., AMP 2021-Poster ST59 ; 2. Smith RE, et al., J Clin Oncol 40, 2022 suppl 16; abstr 1530

Your path to democratizing access to NGS testing

Rapid and easy-to-use point-of-care NGS can help to enable broad access to molecular profiling

Example Clinical Lab

Tracking Number: 0123456789 | Case Number: NGS12345 | Date: 11 May 2022 | 1 of 4

Date of Birth:	01 Aug 1985	Primary Tumor Site:	Lung
Referring Name:	John Doe	Sample Type:	FFPE, Primary Tumor
Case Number:	0123456789	Sample Collected:	08 May 2022

Sample Cancer Type: Non-Small Cell Lung Cancer

Relevant Non-Small Cell Lung Cancer Findings

Gene	Finding	Gene	Finding
ALK	None detected	RET	None detected
